### LETTER OF REFERENCE FOR CTO S.A.

VTT Technical Research Centre of Finland has participated in several public R&D projects together with CTO S.A. such as such as Hydrotesting Alliance. In HTA the objective was to develop a formal and lasting structure to coordinate the definition and introduction of novel measurement, observation and analysis technologies for hydrodynamic model testing.

Based on our experience of CTO S.A. we, together with Helsinki University of Technology, bought four single component force balances from them in 2010. The balances are their own design and have a standard transducer for force measurement.

We are very satisfied with the design, manufacturing quality and accuracy of the balances. Also the delivery was made at the appointed time. The balances are now used in various commercial projects such as model tests for power prediction of a ship.

This statement is presented based on the request from the CTO management.

Ilkka Saisto  
Team Leader, Ship Hydrodynamics  
VTT Technical Research Centre of Finland.
